

EduFinder

Explore India's top universities, courses & fees - in one place.

100 NIRF universities | 493 courses | 22 states

A web application by Manthan - B.Tech, Sharda University

The problem

Choosing a university in India is confusing and scattered.

?

Scattered information

Rankings, courses and fees live on dozens of different websites and PDFs.

Rs

Unclear fees

Annual fees are hard to find, vary by course, and are rarely comparable.

=

No easy comparison

Students can't quickly filter by state, budget or ranking in one view.

!

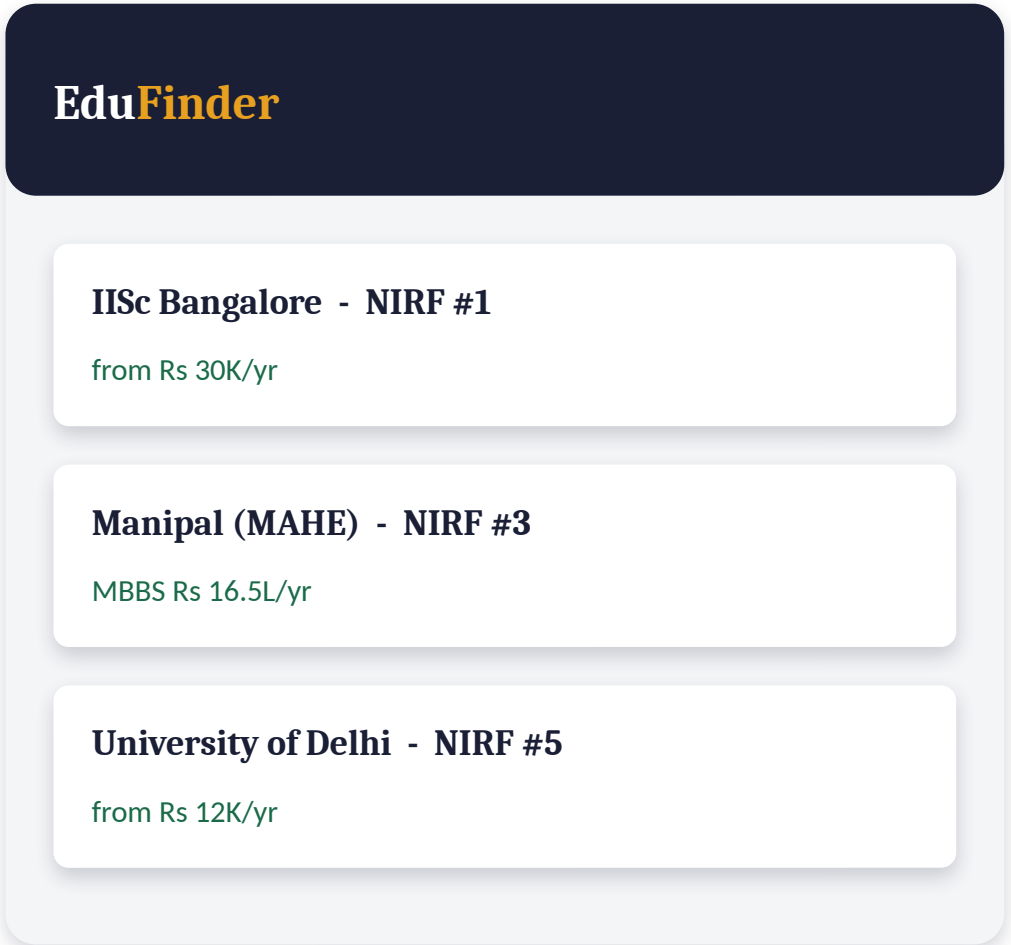

Decision pressure

A high-stakes choice is made with incomplete, inconsistent data.

The solution

EduFinder brings rankings, courses and indicative fees into one searchable app.

- One place for 100 top NIRF-ranked universities
- Every card shows location, rating, rank & starting fee
- Search across names, cities, states and courses
- Filter by state and budget; sort by rank, rating or fee
- Detail page lists courses with visual fee comparison

Key features

S

Smart search

Match by university name, city, state or any course keyword.

F

State filter

Narrow results to any of 22 states instantly.

Rs

Budget slider

Show only universities under a chosen annual-fee ceiling.

S

Flexible sort

Order by NIRF rank, rating, or fees (low to high / high to low).

D

Detail pages

Per-university course list with visual fee-comparison bars.

U

Clean UI

Fast, responsive cards with a consistent brand system.

Tech stack & architecture

Frontend

HTML + Jinja2 templates, custom CSS - responsive cards, no framework overhead

v

Backend

Python + Flask - routing, search, filter, sort and fee-formatting logic

v

Data layer

Supabase (PostgreSQL) - universities + courses via foreign key; served as JSON

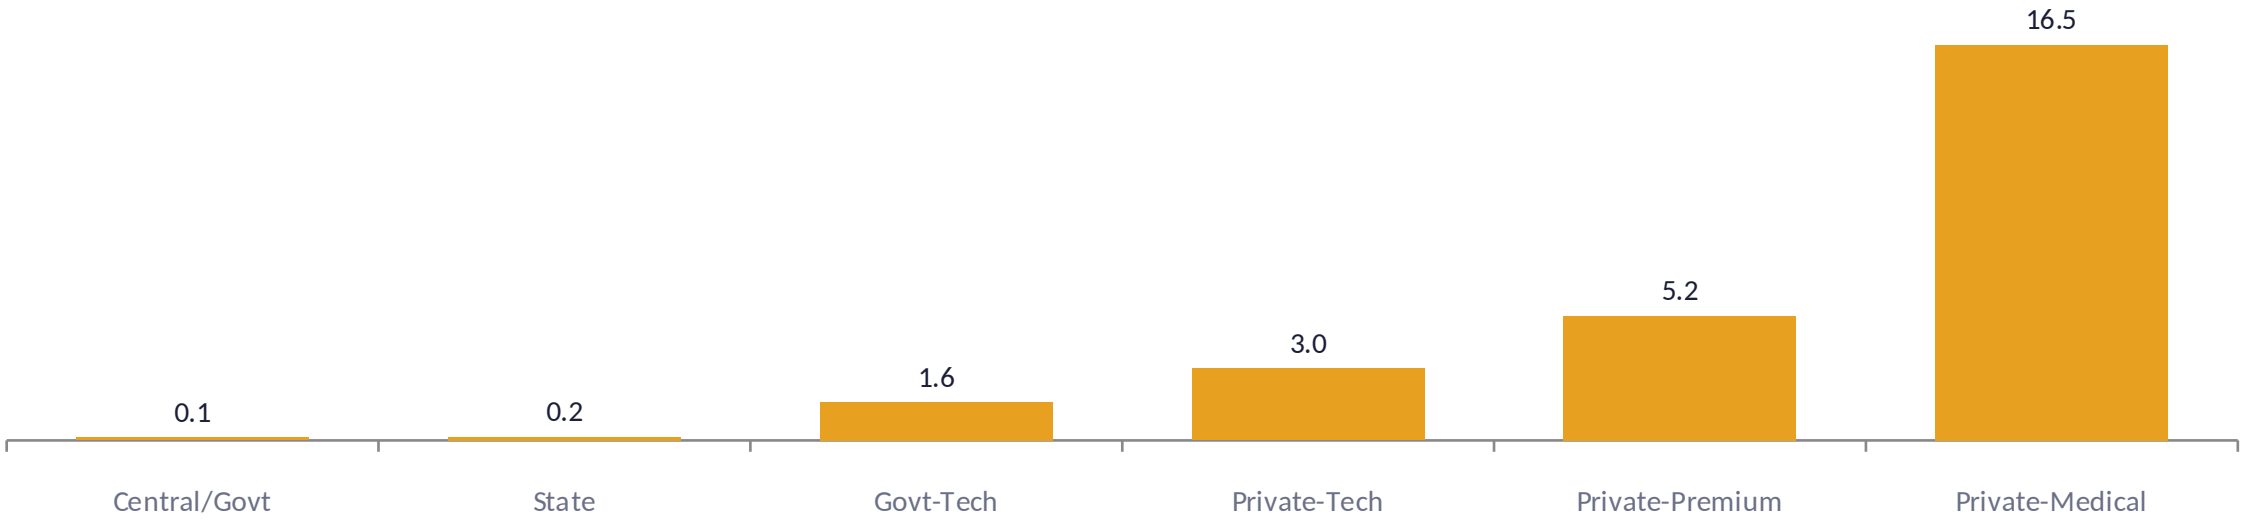

Why this stack

- Python-first - no JavaScript needed
- Flask is light and fast to demo
- Jinja renders data straight to HTML
- Postgres scales to real datasets
- Same JSON shape as a REST API

The dataset

100	493	22	61
universities	courses	states	cities

Indicative annual fee by institution type (Rs lakh)

How it works

1

Search / filter

User types a query or sets state & fee filters on the home page.

>

2

Flask processes

The route reads query params and filters the university list in Python.

>

3

Sort & render

Results are sorted and passed to Jinja, which renders university cards.

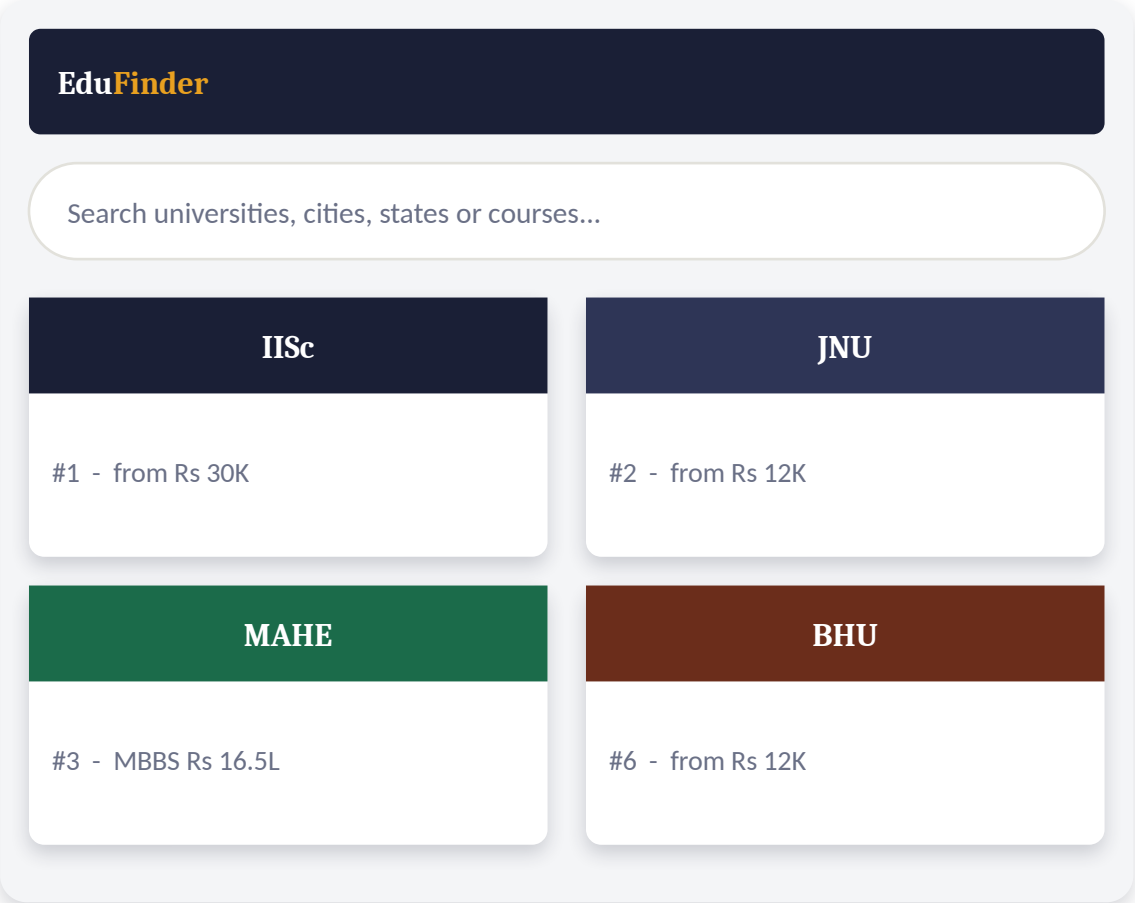

>

4

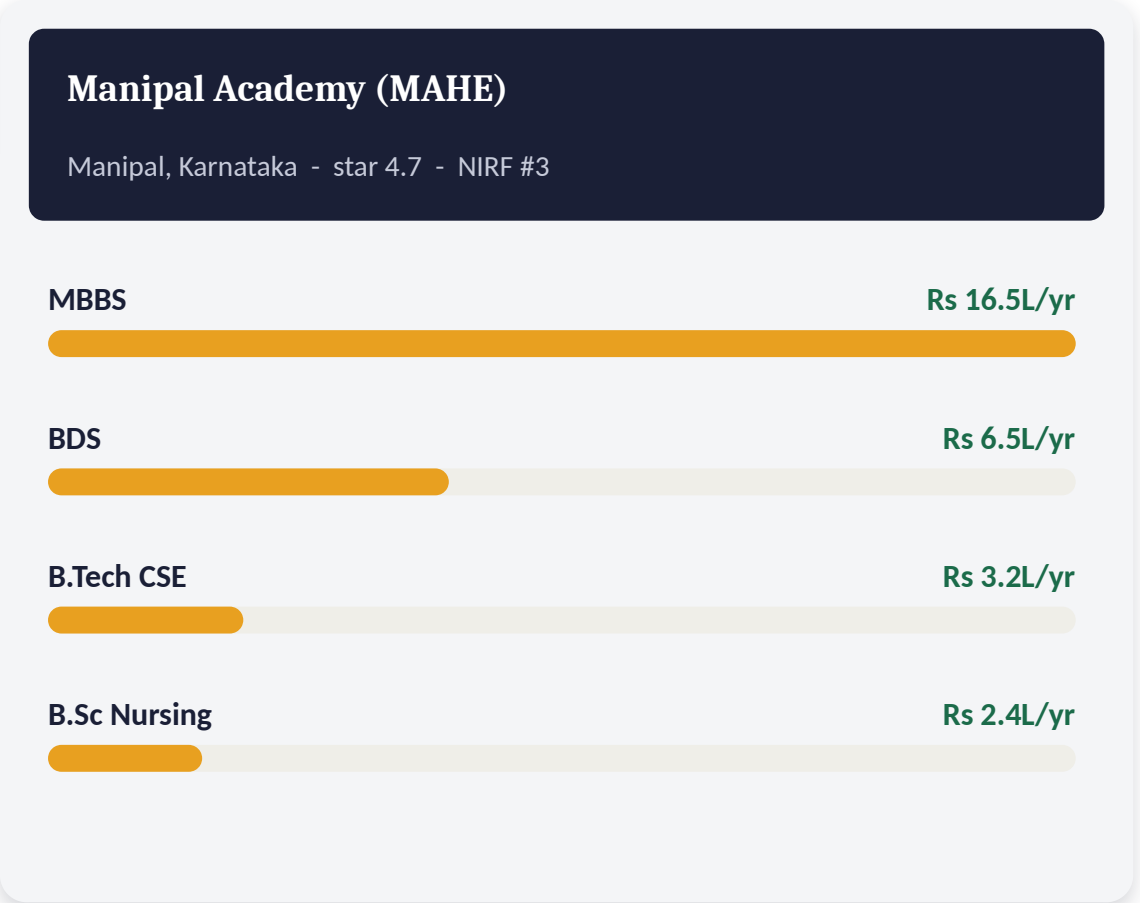

Explore detail

Clicking a card opens its courses with visual fee-comparison bars.

Inside the app

Home - searchable card grid

Detail - courses & indicative fees

Roadmap & future scope

Now

MVP prototype

100 universities, search/filter/sort, detail pages with indicative fees.

Next

Verified fees & official links

Exact category-wise fees pulled and cited from official sources.

Later

Compare & save

Side-by-side comparison, shortlists, and student accounts.

Vision

Reviews & admissions

Student reviews, cut-offs, and application deadlines in one hub.

Thank you

EduFinder - find your university.
