# ProofOfWork

An animated, framework-free personal portfolio · Manthan Dhanraj

# The Idea

- Most student portfolios are static, templated pages.
- ProofOfWork is different: the portfolio itself demonstrates engineering ability.
- Smooth animation, live data, clean architecture — literally proof of work.
- Ships as one index.html + assets. No frameworks, no build step.

# Features

- Animated splash with a self-drawing logo
- Swipeable section carousel: Profile, Academics, Projects, Achievements, Certificates
- Live GitHub contribution graph + latest repos (GitHub API)
- Rich project pages: language graph, tech chips, screenshots, docs
- Built-in 'Ask about Manthan' chatbot
- Light/dark theme, responsive, PWA-ready

# Tech Stack

- Vanilla JavaScript (ES6) — all logic, no framework
- HTML5 + CSS3 — custom properties, grid/flex, keyframe animation
- Inline SVG for crisp graphics and the logo
- GitHub REST API for live data
- Google Fonts: Space Grotesk, Inter, JetBrains Mono
- Fully static — deployable to any host

# How It Works

- State lives in a single JS data structure (profile + projects)
- UI is generated from that data at runtime
- Lightweight DOM router toggles screens
- CSS-driven animations for performance
- Client-side data fetch with graceful offline fallbacks

# Highlights

- Data-driven: add a project = append one object
- Contribution graph built by date, animated as a wave + shimmer
- Every network feature has a fallback — nothing breaks offline
- Single file, instant load, zero dependencies
